EDUCATION

B.S. in Computer Science — **Expected Dec 2026**

University of Central Florida • Orlando

Relevant Coursework: Computer Science I & II, Database Systems, Computer Networks, Artificial Intelligence, Software Design, Security in Computing

EXPERIENCE

Backend Software Engineer Intern · **US Hunger** — **May 2026 – Present**

- Contributed to backend development in a .NET environment, leveraging SQL stored procedures for data access and business logic
- Worked within AWS-hosted architecture to support scalable backend systems
- Built and deployed an AI-powered full-stack web app that generates editable event-layout PDFs from venue blueprints using the OpenAI API, reducing floor planning from hours of manual work to minutes

PROJECTS

VISOR — Kotlin · Python · Supabase · FastAPI

- Developed an AI-powered Android application paired with META glasses to assist low-vision users, combining real-time scene description, hazard detection, depth estimation, TTS, and STT into a unified assistive experience
- Integrated Depth-Anything-V2 to perform monocular depth estimation from camera frames, enabling the app to infer spatial proximity and alert users to nearby objects
- Implemented and fine-tuned YOLOv11 for real-time hazard detection, training the model on domain-specific classes to identify obstacles relevant to low-vision navigation
- Provisioned and managed an AWS EC2 instance to host and serve backend AI models, configuring the server environment to handle inference requests from the mobile client at low latency

WorkBench — .NET · SQL · React

- Built a full-stack workout tracking application using React 19, TypeScript, and Tailwind CSS on the frontend, backed by a C# / ASP.NET Core REST API and a SQL database accessed via a custom repository pattern
- Designed and implemented a relational data model across four core entities (users, workouts, exercises, sets), writing raw SQL queries and encapsulating data access logic through a clean repository layer with a shared connection factory
- Integrated interactive data visualization using Recharts to display workout history and progress trends, alongside a component library (shadCN/ui + Radix UI) to deliver a polished, accessible user interface

Computer Modes — Python · Shell Scripting · Launch Daemons

- Developed a permanent menu bar icon, utilizing RUMPS to create a button functioning as a dropdown menu with selectable options to only have certain processes running based on the selected mode
- Set up the plist document so that the icon would run in the background on macOS using a Launch Daemon
- Automated certain applications and websites to open, while closing the previously open applications

DayFlow — MongoDB · Express · React Native · Node.js · Nativewind · NativeCN

- Built DayFlow, a full-stack mobile productivity app using React Native (Expo/TypeScript), Node.js/Express, and MongoDB with a modular REST API supporting full CRUD across tasks, goals, and calendar features
- Implemented secure user authentication with JWT, bcrypt, and Plaid API integration for bank account linking
- Styled a reusable component library using NativeWind (Tailwind CSS) and built UI features including a dynamic time-blocked daily timeline and goal progress tracking

SKILLS

Languages	JavaScript, Python, HTML/CSS, Java, C, Dart, TypeScript
Frontend	React, React Native, Flutter, Tailwind CSS, shadCN
Backend	.NET/C#, Node.js, Express.js, RESTful APIs, MongoDB, SQL
Tools	Git/GitHub, VS Code, Jira, AWS
